

1.What is Data Loading in Power BI and why is it considered the first step of analysis?

Answer:

Data Loading in Power BI is the process of importing data from differences such as Excel,CSV,SQL databases or online services into Power BI. It is considered as the first step of anaysis because data must be available in Power BI before performing cleaning,transformation,visualization or report creation.

Examble:

In the Corono_Virus_2020 datase,details like country,State,Confirmed Cases and Vaccination Status are first loaded ino Power BI for further analysis.

2.Explain the difference between “Load” and “Transform Data” in Power BI.

Answer:

Load:Load is the process of importing data directly into Power BI from sources like Excel,CSV or SQL databases.In this step,the data is added without making any changes.

Transform Data:Transform Data is the process of cleaning and modifying the data before loading it into Power BI.It includes removing duplicates,replacing null values ,changing data types and filtering data to improve data quality .

3.What is a Fact Table and a Dimension Table? Give examples from the dataset.

Answer:

Fact Table:A Fact table contains numerical or measurable values used in analysis.

Example:

- Confirmed Cases
- Recovered Cases
- Death Cases

Dimension Table: A Dimensional Table contains descriptive information that explains the facts.

Example:

- Country
- State
- Date
- Vaccination Status

Fact and Dimension tables together help in creating proper data models in Power BI.

4. Why is Star Schema preferred over Snowflake Schema in Power BI?

Answer:

Star Schema is preferred because it is simple, easy to understand and provides better performance in Power BI. In this schema, one Fact Table is directly connected to multiple Dimension Tables.

Advantages:

- Faster query performance.
- Easy data modelling.
- Better report generation.
- Requires fewer table joins.

Compared to Snowflake Schema, Star Schema reduces complexity and improves analysis speed.

5. Identify and remove duplicate records based on Date, Country, and State?

Answer:

- Transform the data .
- Open Power Query Editor.

- Select Date, Country and State Columns.
- Click on **Remove Duplicates** under the Home tab.

After clicking it, Power BI removes all repeated records from the selected rows.

6. Identify and replace null values in Vaccination_Status?

Answer:

- Open Power Query Editor.
- Select the Vaccination_Status Column.
- Use **Replace Values** option.
- Replace "null" values with "unkown" or "Not Vaccinated".

This helps in maintaining clean and complete data.

7.Create a new column to calculate Recovery Rate?

Answer:

- Open Table View.
- At the top menu **Table Tools** and add new column.
- Click on **New Column**
- Write the formula:
 - $\text{Recovery Rate} = (\text{'coronavirus_2020_dataset' [Recovered_Cases]} / \text{'coronavirus_2020_dataset' [Confirmed_Cases]} * 100)$
- Press Enter.

Now the Recovery Rate column will be created.

Table: coronavirus_2020_dataset (500 rows) Column: Recovery Rate (500 distinct values)

8. Create a summarized table showing total confirmed cases by Country.

Answer:

- Click on **Data View** icon
- Click Table Tools.
- Click on **New Table**
- A formula bar will appear at the top.
 - Country Summary =
`SUMMARIZE('coronavirus_2020_dataset','coronavirus_2020_dataset'[Country], "Total Confirmed Cases", SUM('coronavirus_2020_dataset'[Confirmed_Cases]))`
- Press Enter .

Power BI will automatically create a new summarized table called **Country Summary**.
